

# **CIT 103 & CIT 104**

## **Object Oriented Programming**

**By**

*Md. Palash Uddin*

*Lecturer*

*Dept. of CIT*

*Hajee Mohammad Danesh Science and Technology  
University, Dinajpur.*

# Inheritance

- > **Inheritance:** Ability to **derive new objects** from old ones
  - permits objects of a more specific class to inherit the properties (data) and behaviors (functions) of a more general/base class
  - ability to define a hierarchical relationship between objects
- > A child inherits characteristics of its parents
- > Besides inherited characteristics, a child may have its own unique characteristics

# Inheritance in Classes

- > Objects of one class acquire the properties of another class
- > If a **class B inherits from class A** then it contains all the characteristics (information structure and behavior) of class A
- > The parent class (Class A) is called **base class** and the child class (Class B) is called **derived class**
- > Besides inherited characteristics, derived class may have its own unique characteristics

## Example – Inheritance

## Example – Inheritance

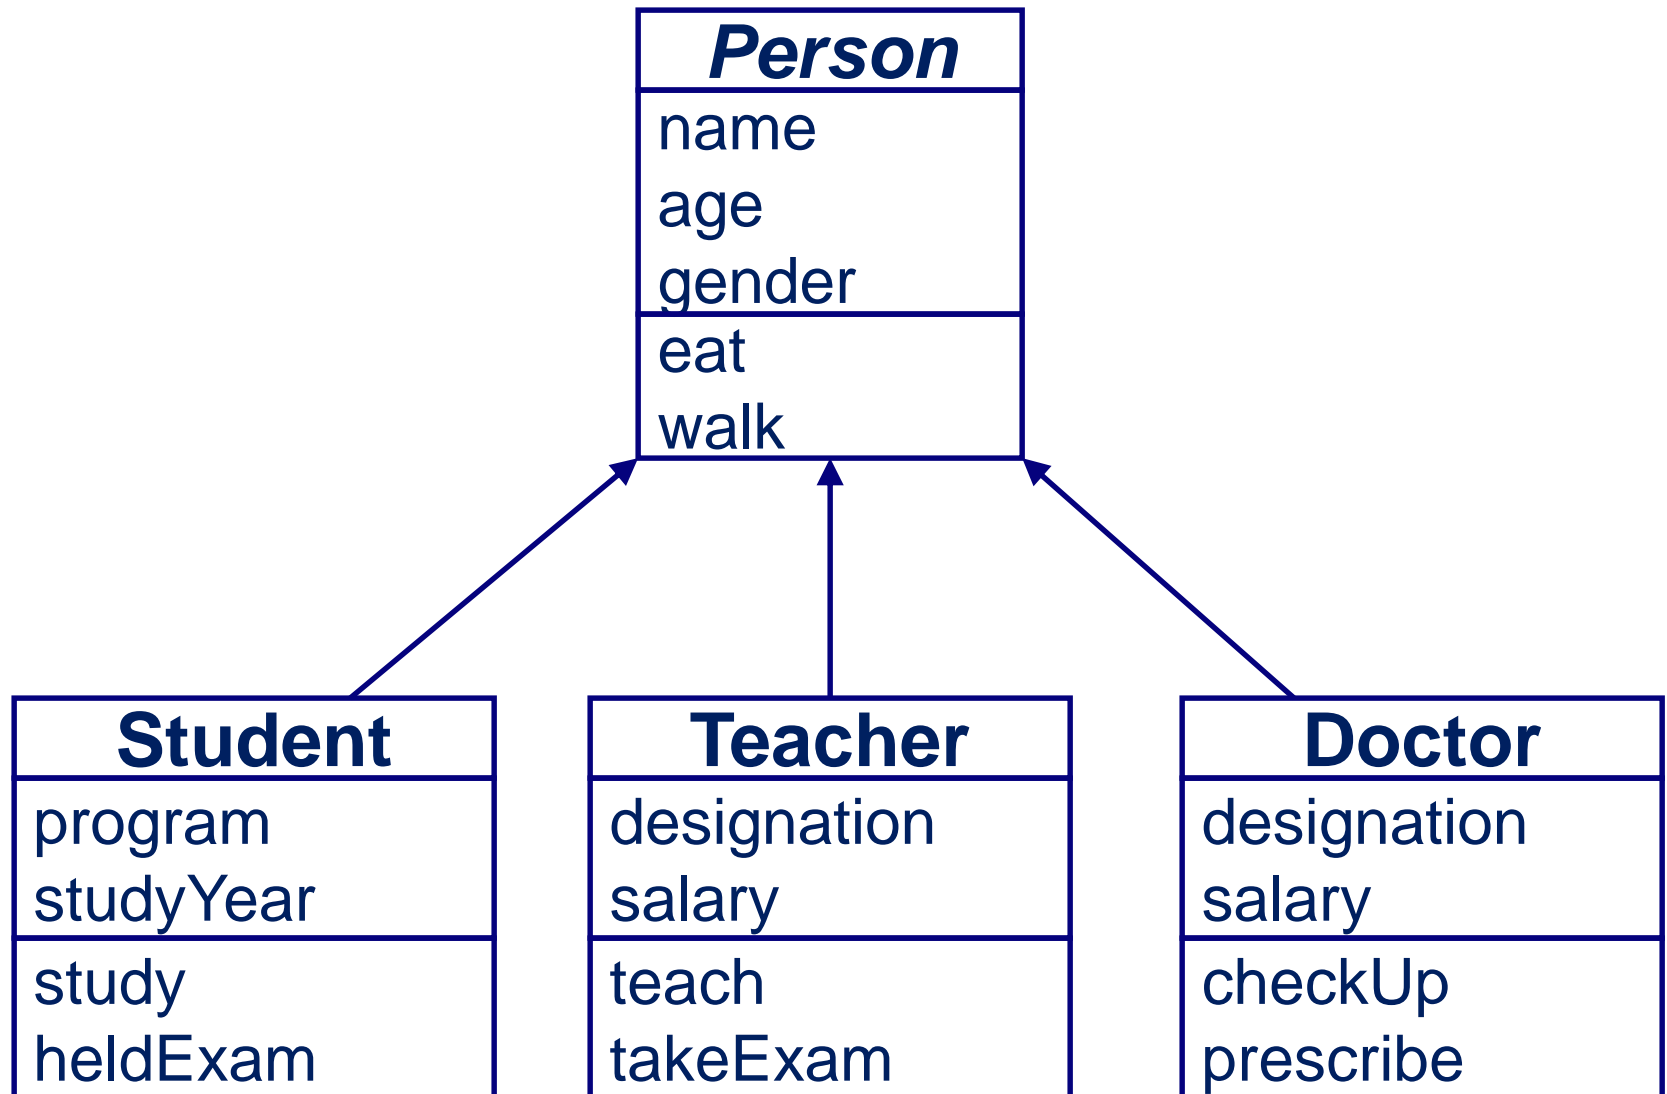

# Inheritance – “IS A” or “IS A KIND OF” Relationship

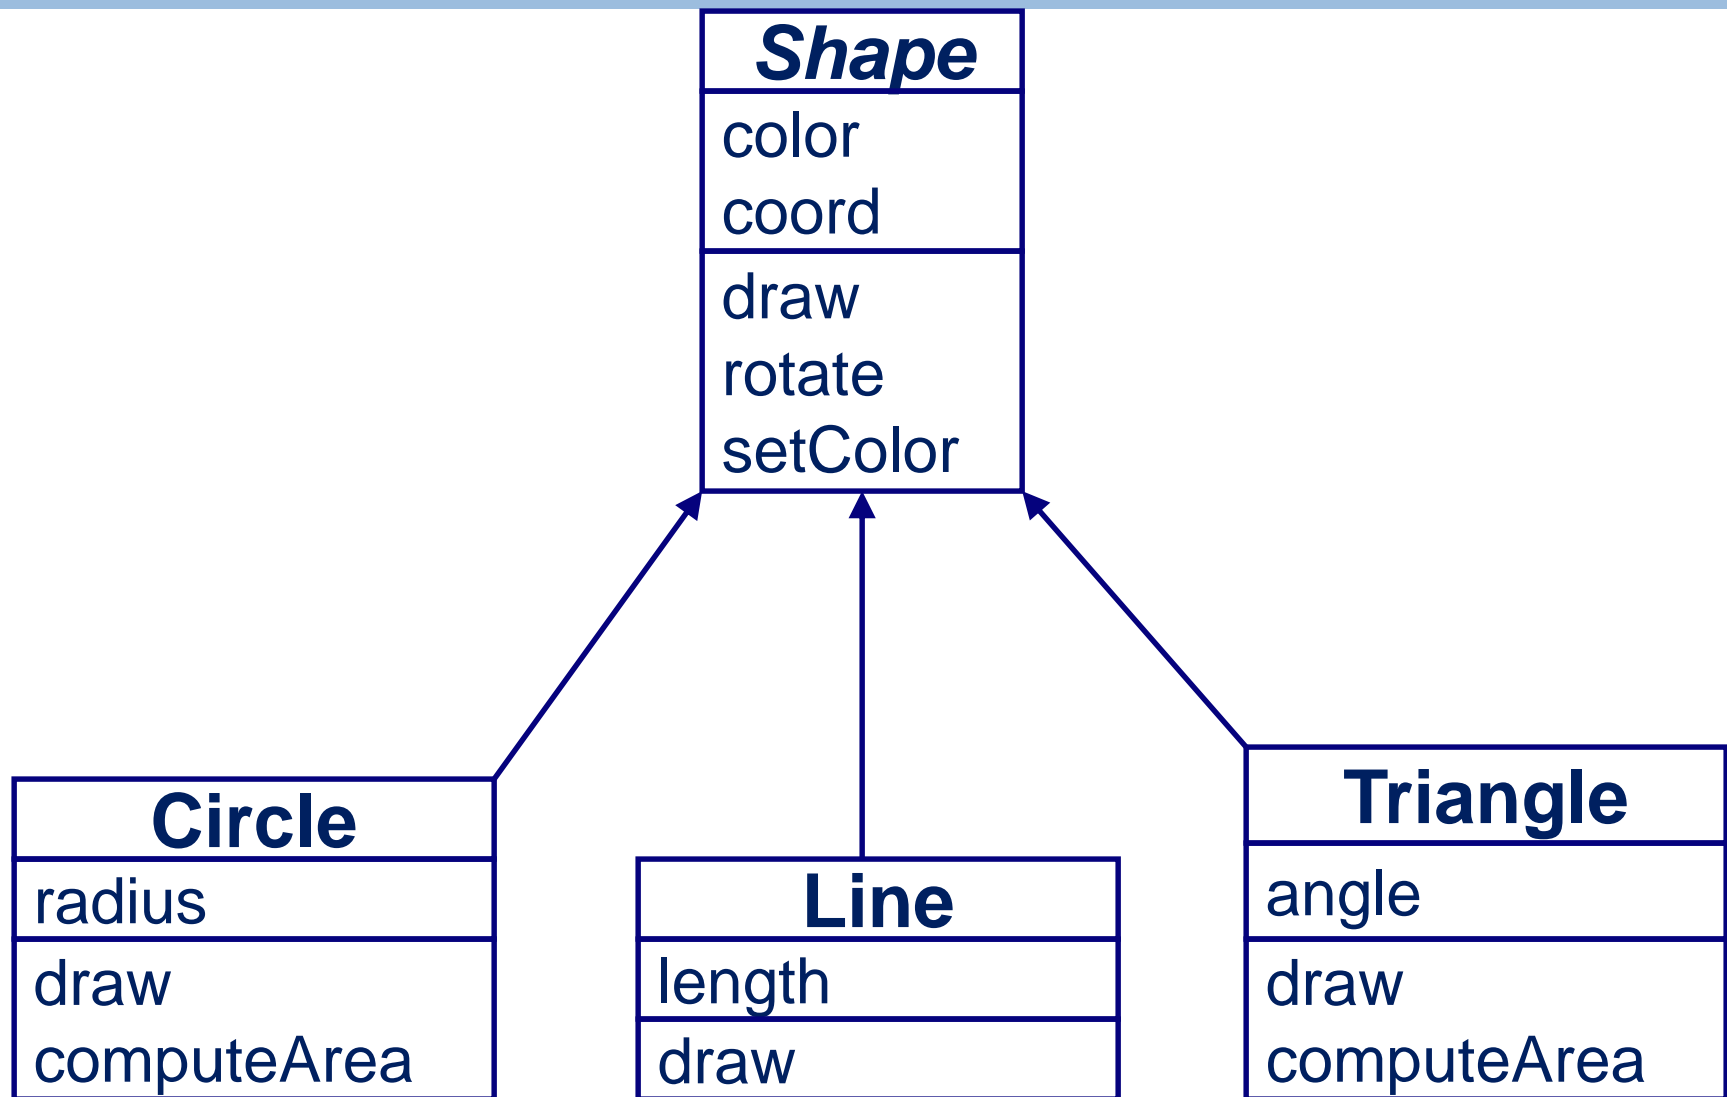

---

- > Each derived class **is a** special kind of its base class

# Example – “IS A” Relationship

# Example – “IS A” Relationship

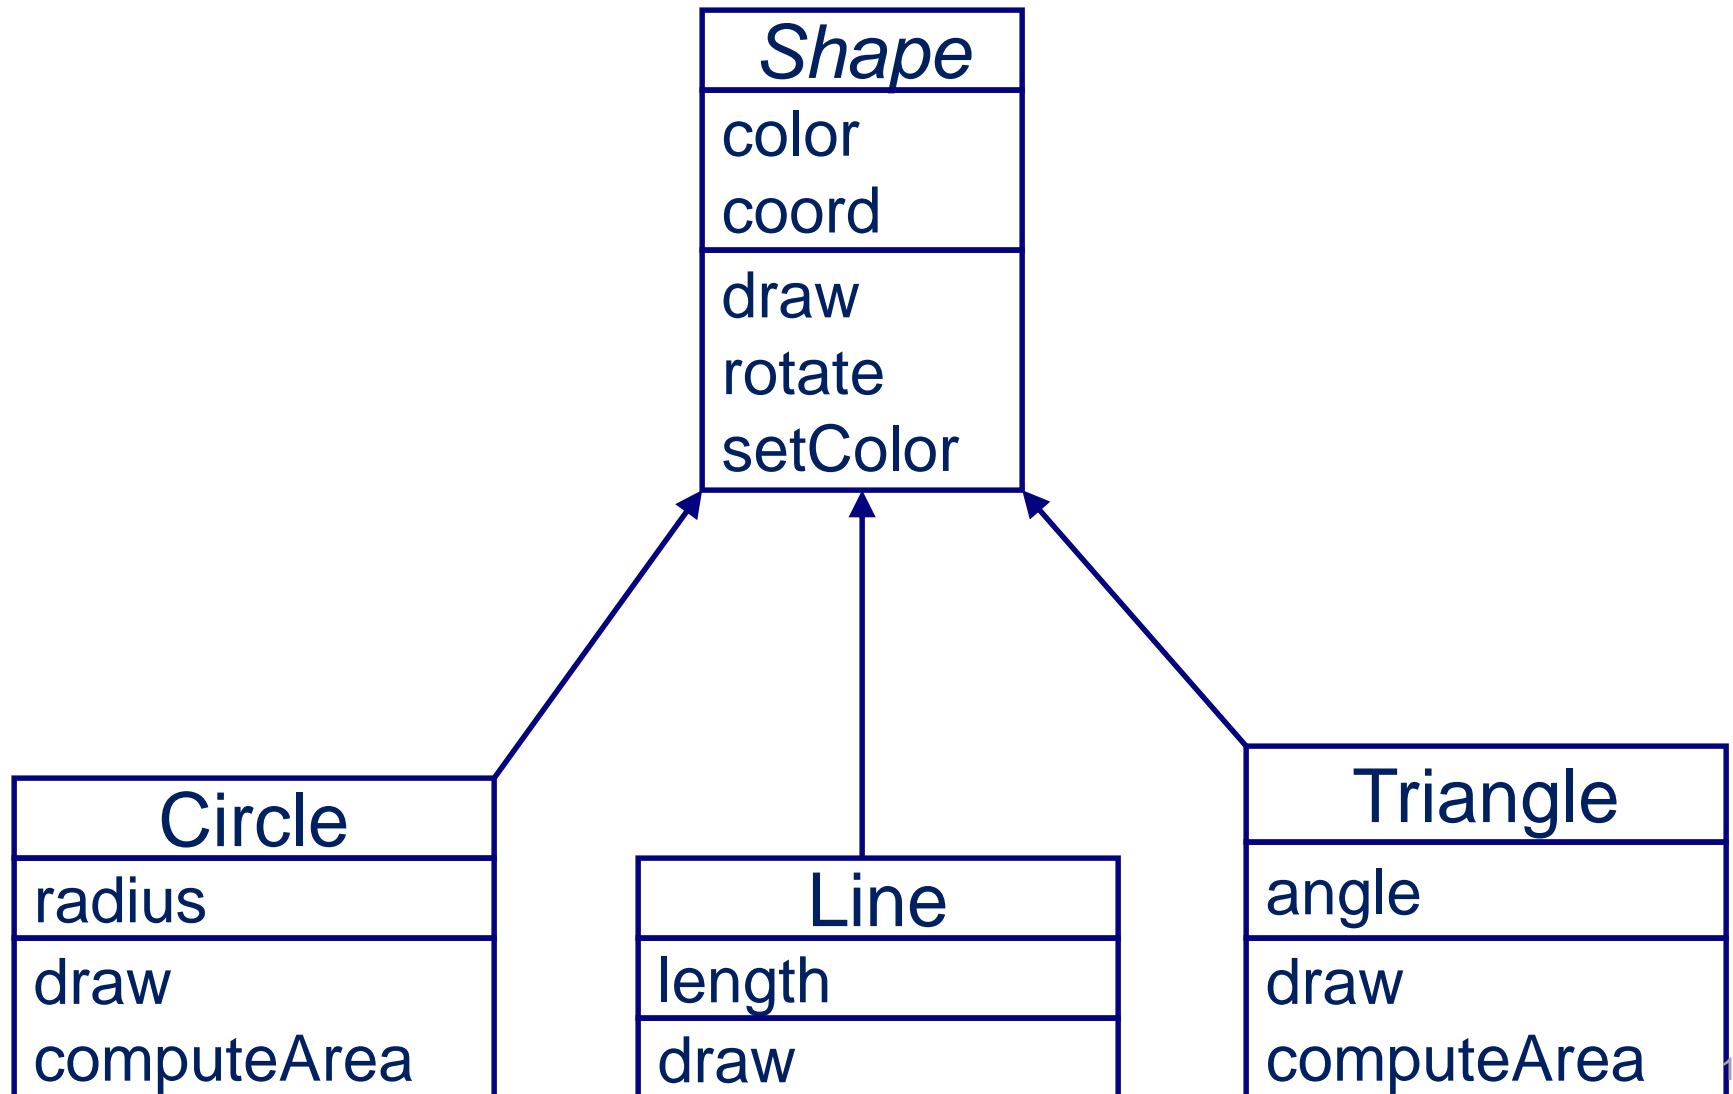

# Inheritance – Advantages

- > **Reuse**
- > Less redundancy
- > Increased maintainability

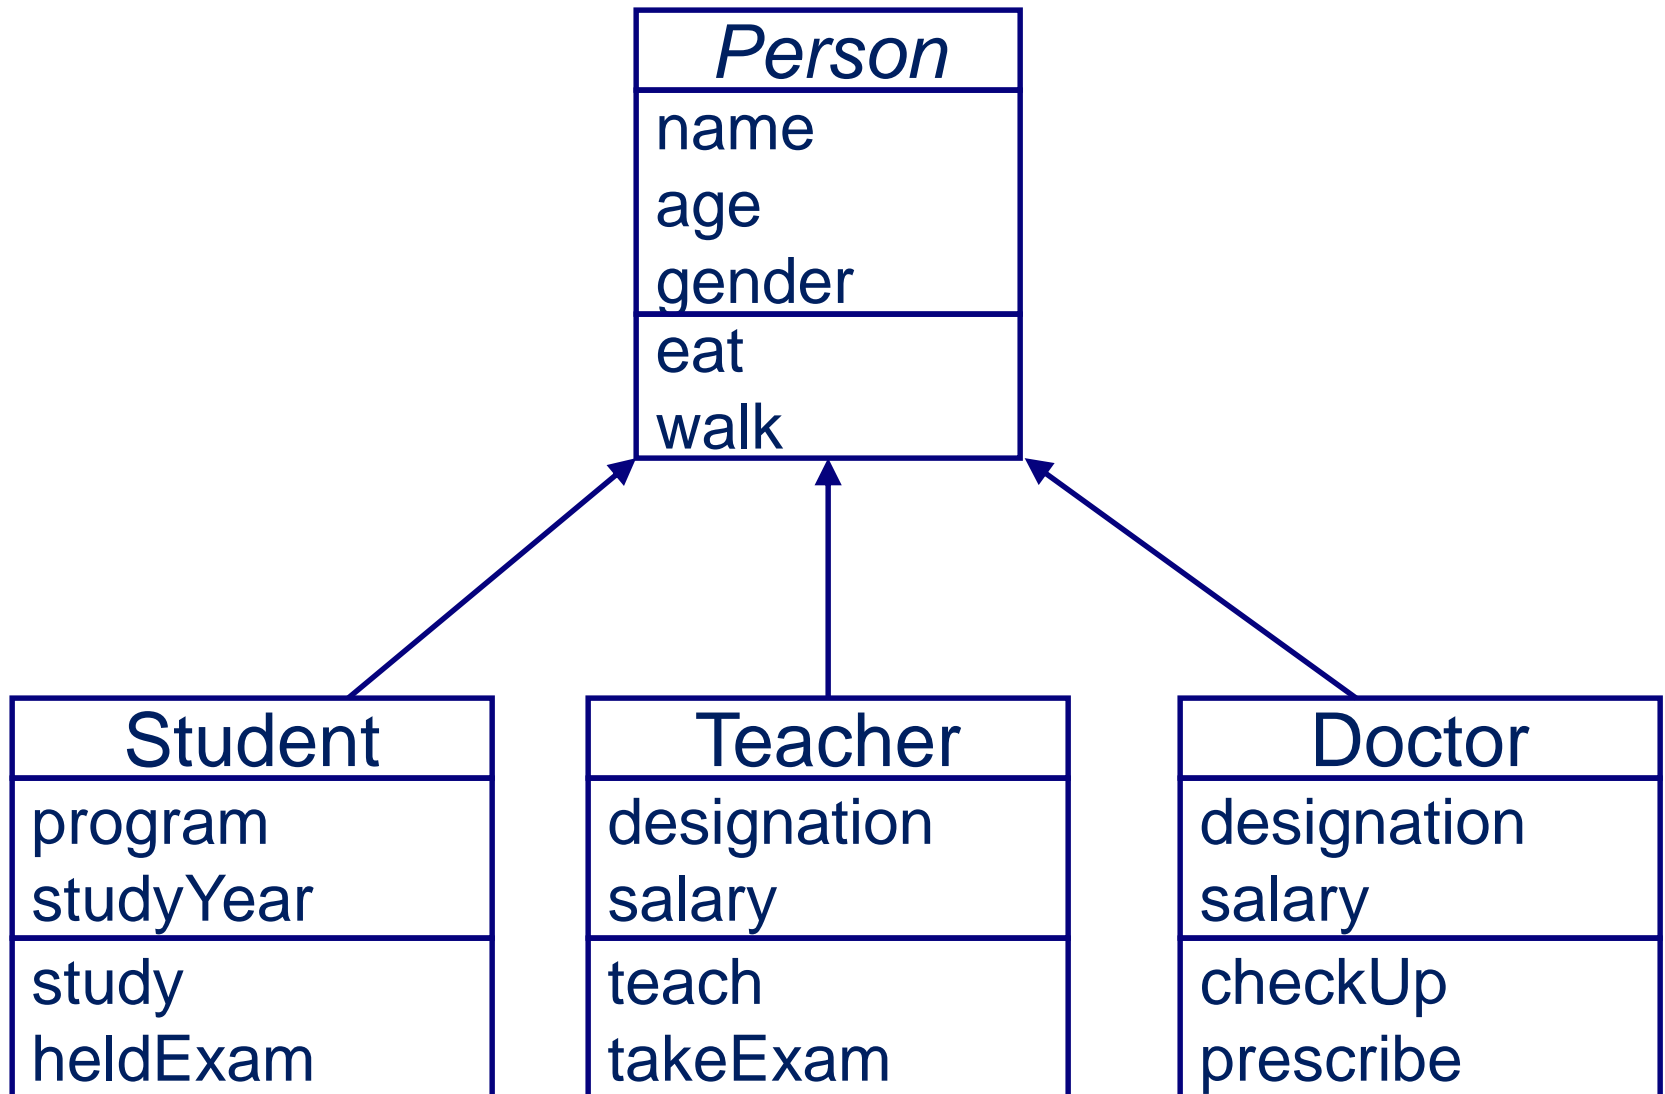

# Reuse with Inheritance

- > Main purpose of inheritance is **reuse**
- > We can easily add new classes by inheriting from existing classes
  - Select an existing class closer to the desired functionality
  - Create a new class and inherit it from the selected class
  - Add to and/or modify the inherited functionality

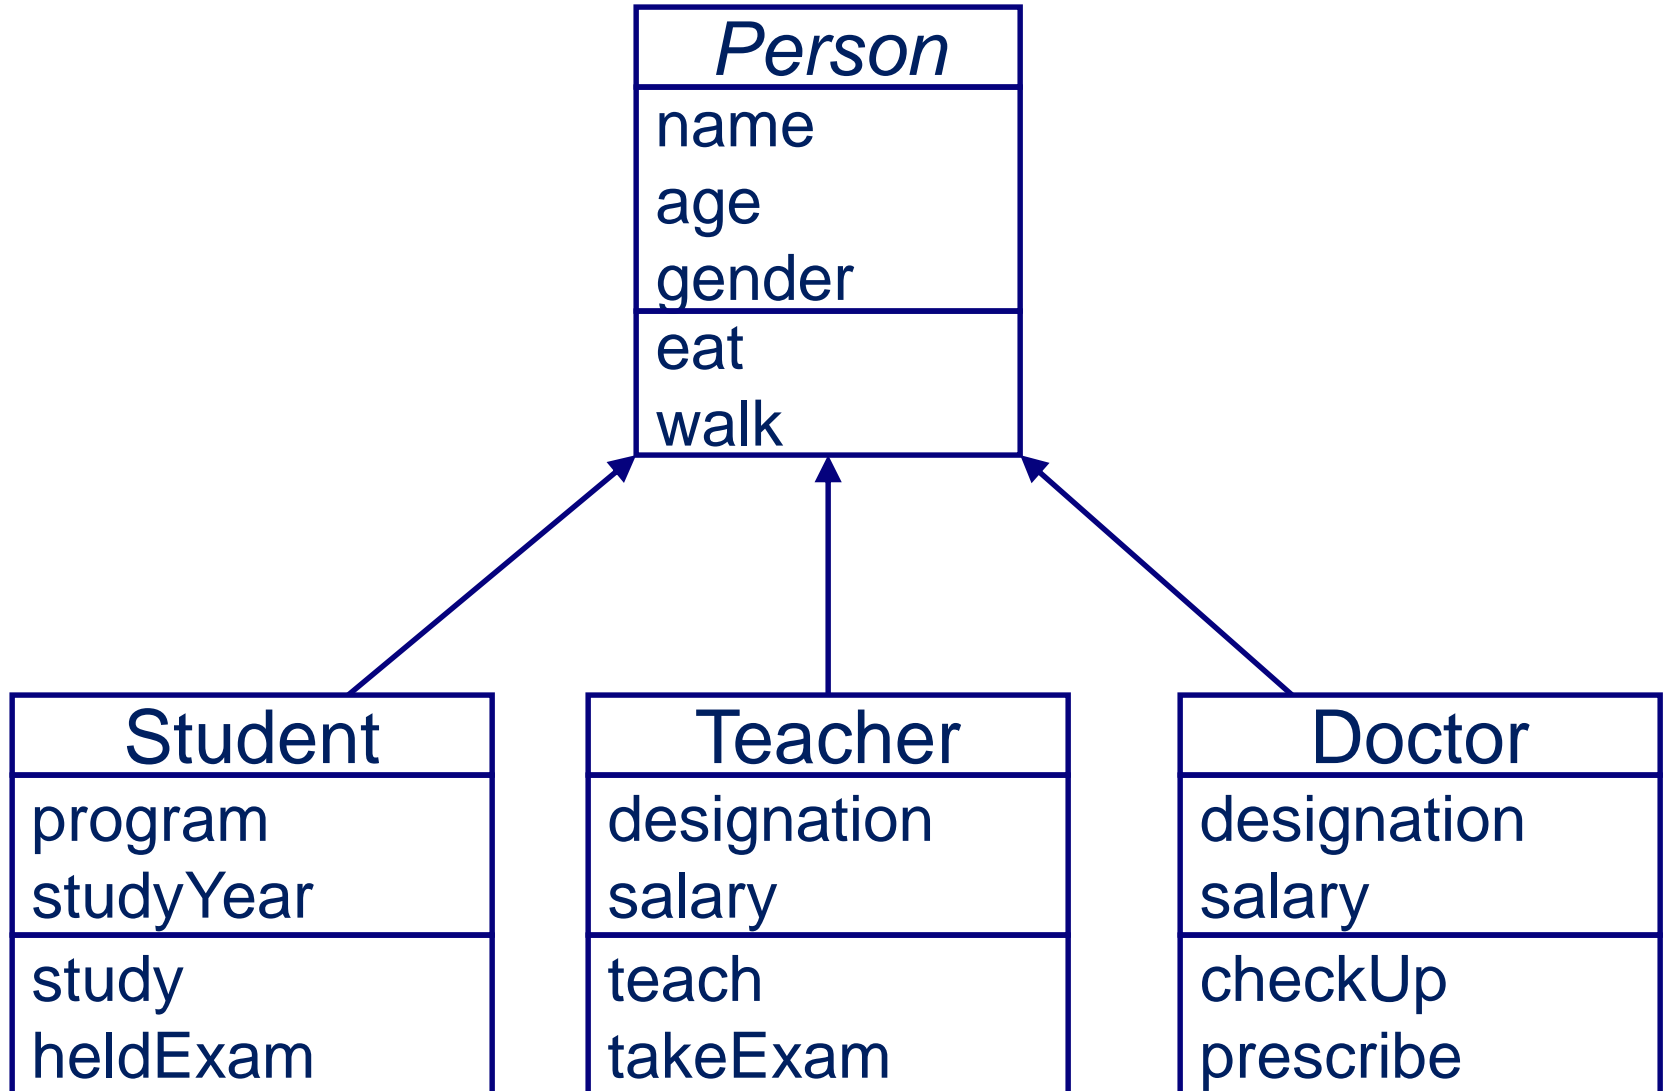

# Example Reuse

# Example Reuse

# Example Reuse

# Recap – Inheritance

- > Derived class inherits all the characteristics of the base class
- > Besides inherited characteristics, derived class may have its own unique characteristics
- > Major benefit of inheritance is **reuse**

# Concepts Related with Inheritance

- > Generalization
- > Subtyping (extension)
- > Specialization (restriction)

# Generalization

---

- > In OO models, some classes may have common characteristics
- > We extract these features into a new class and inherit original classes from this new class
- > This concept is known as Generalization

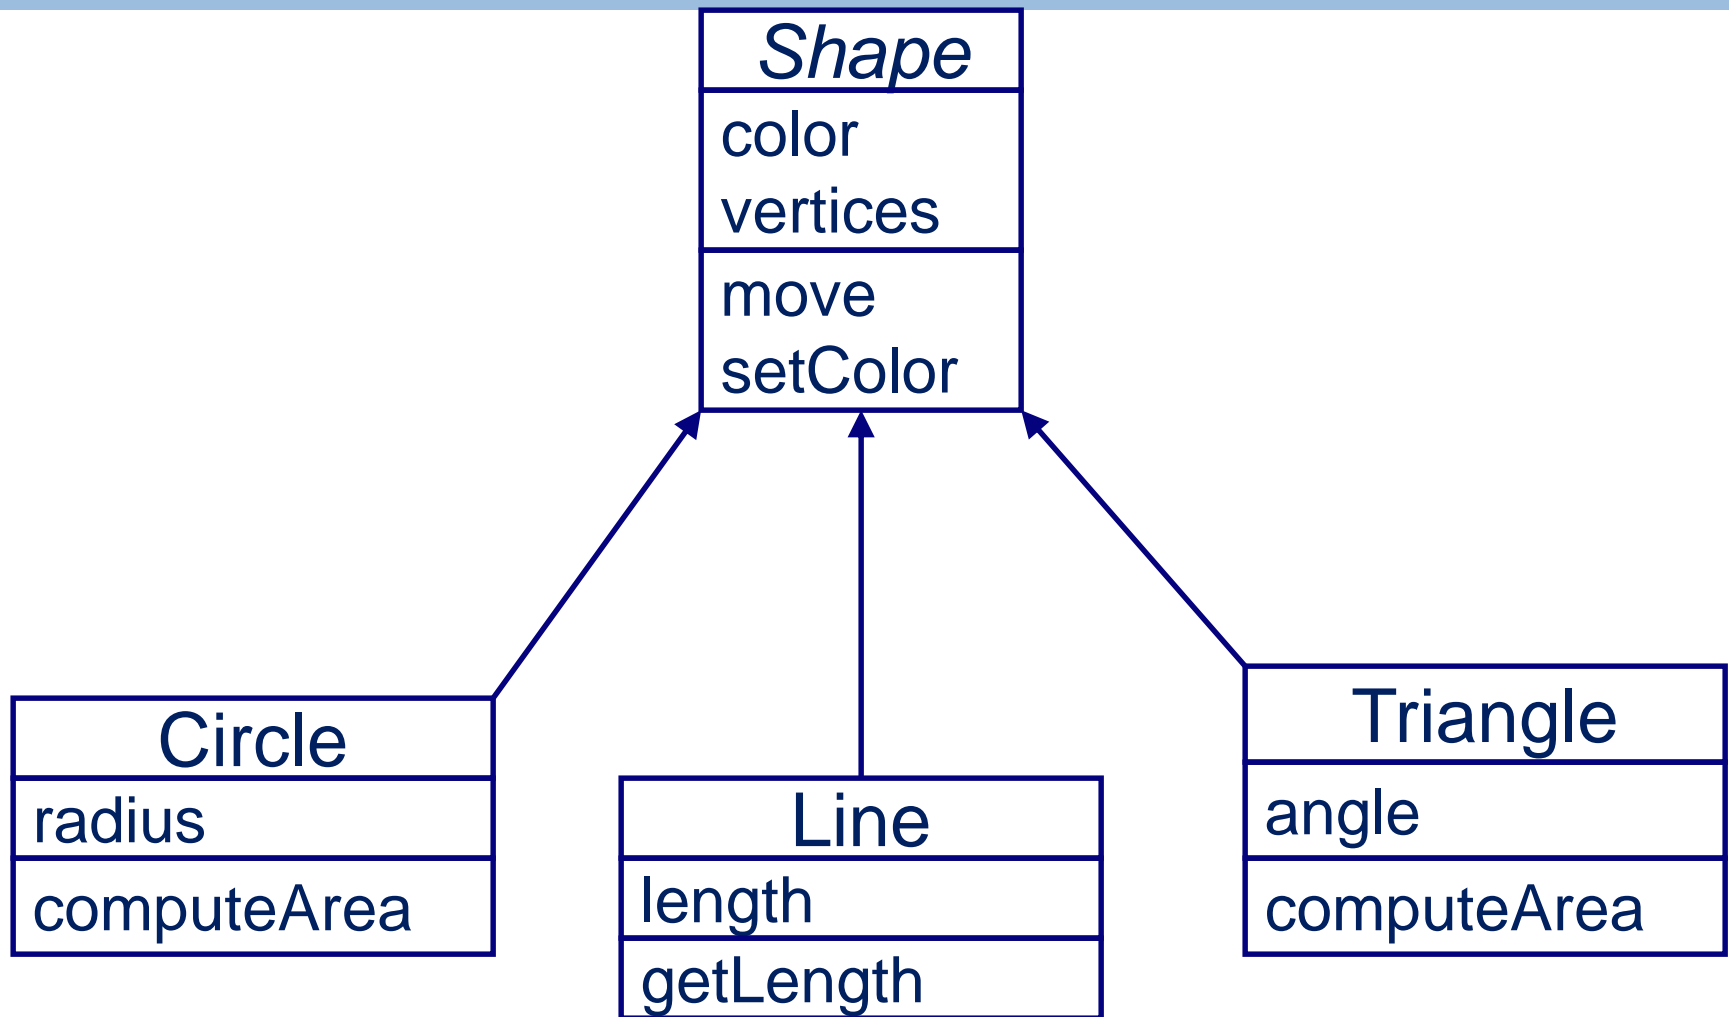

## Example – Generalization

Line
color vertices length
move setColor getLength

Circle
color vertices radius
move setColor computeArea

Triangle
color vertices angle
move setColor computeArea

## Example – Generalization

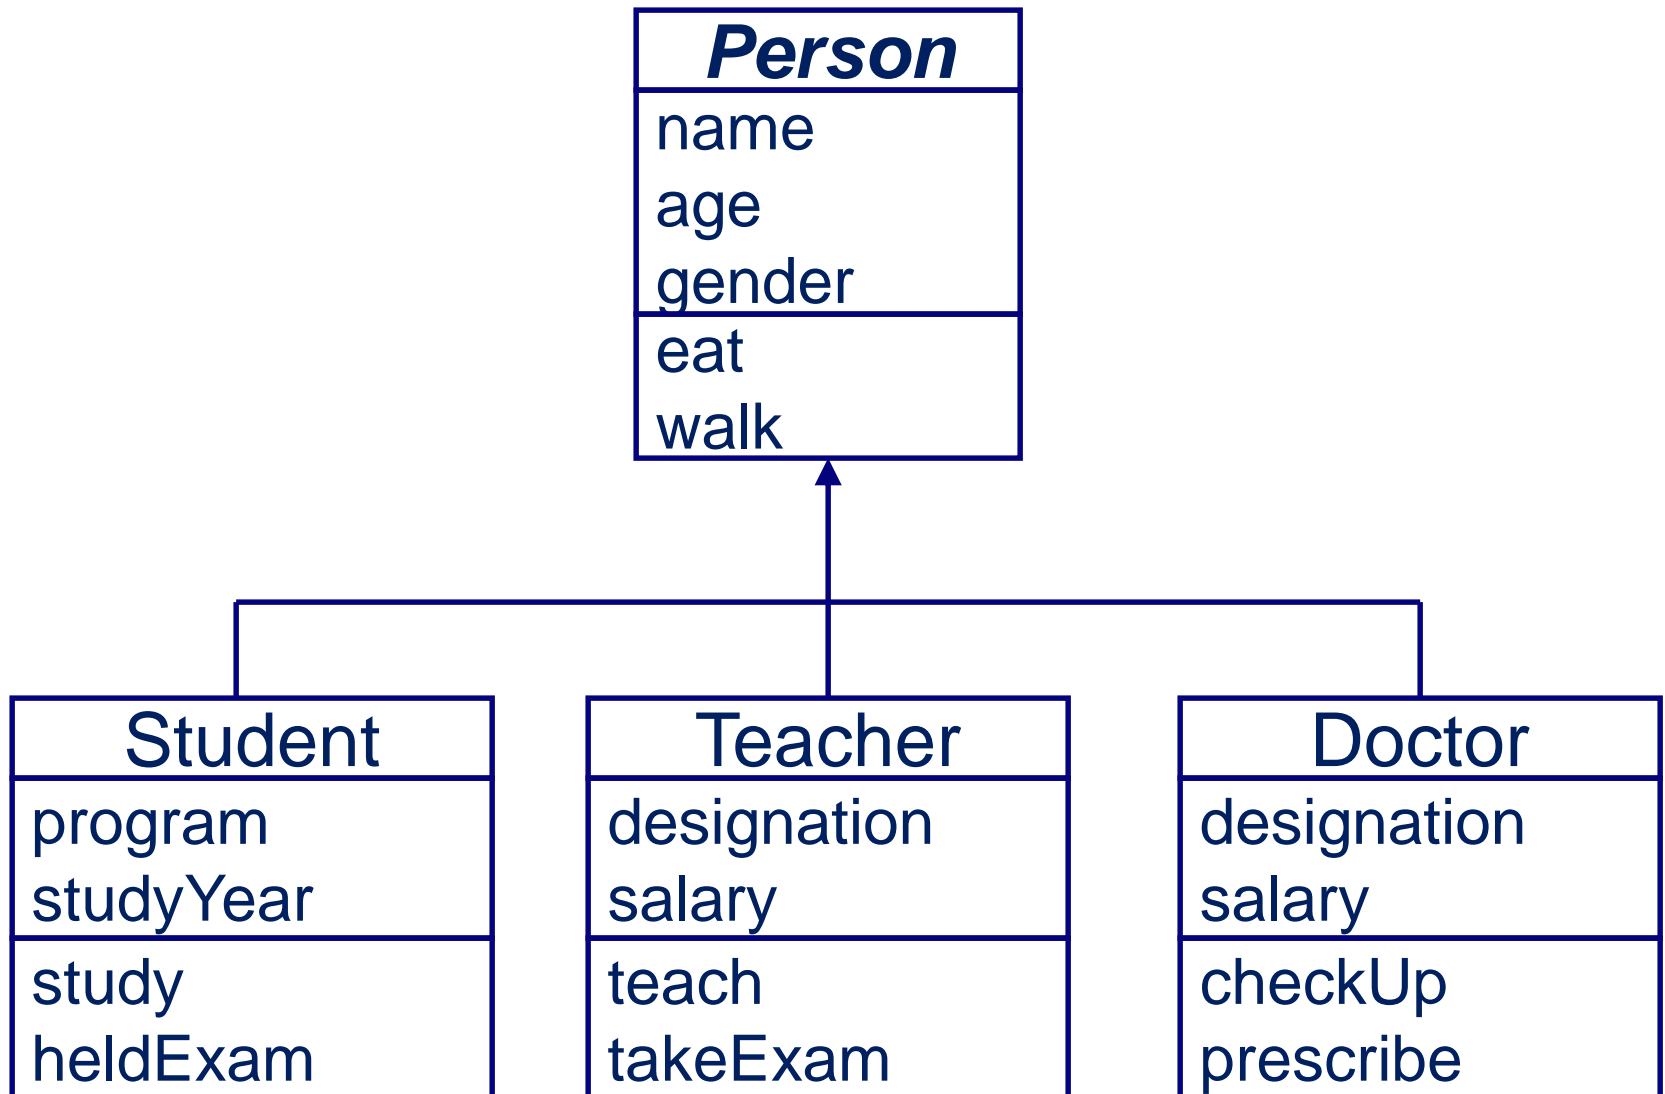

# Example – Generalization

Student
name
age
gender
program
studyYear
study
heldExam
eat
walk

Teacher
name
age
gender
designation
salary
teach
takeExam
eat
walk

Doctor
name
age
gender
designation
salary
checkUp
prescribe
eat
walk

# Example – Generalization

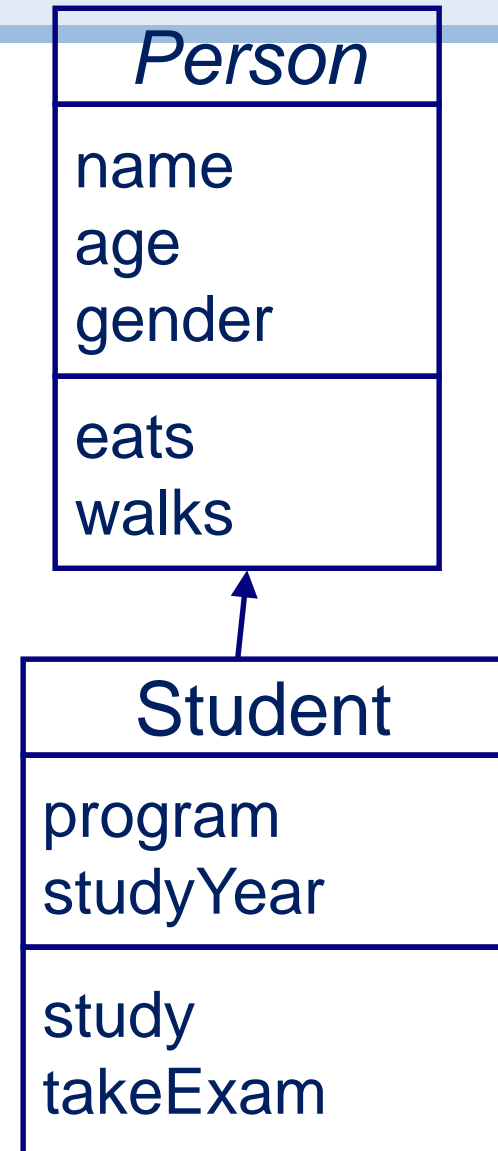

# Sub-typing & Specialization

- > We want to add a new class to an existing model
- > Find an existing class that already implements some of the desired state and behavior
- > Inherit the new class from this class and add unique behaviour to the new class

# Sub-typing (Extension)

- > Sub-typing means that derived class is behaviorally compatible with the base class
- > Behaviorally compatible means that base class can be replaced by the derived class

# Example –Sub-typing (Extension)

## Example – Sub-typing (Extension)

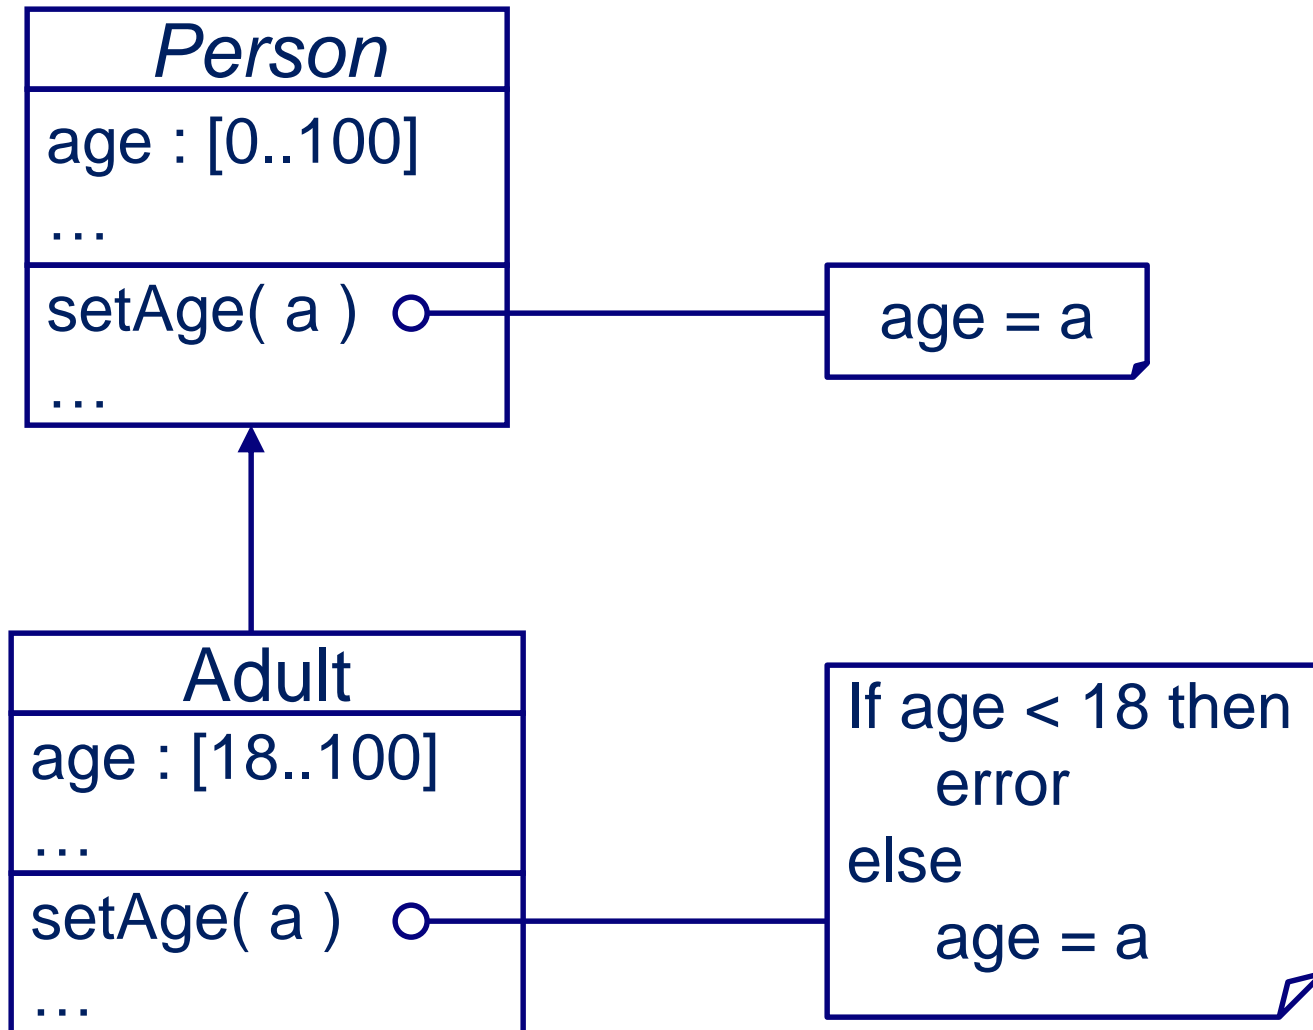

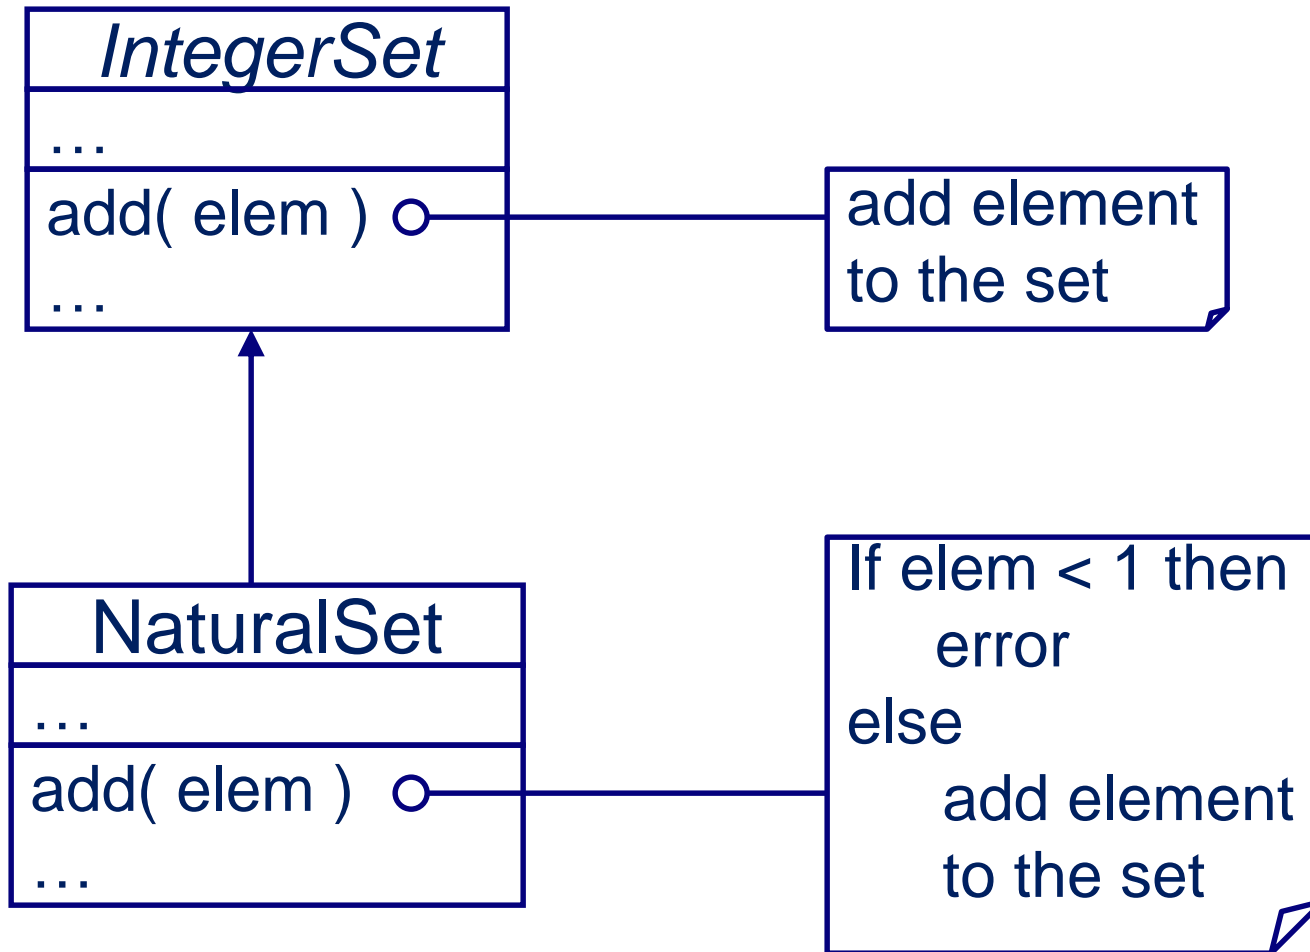

# Specialization (Restriction)

- > Specialization means that derived class is behaviorally incompatible with the base class
- > Behaviorally incompatible means that base class can't always be replaced by the derived class

# Example – Specialization (Restriction)

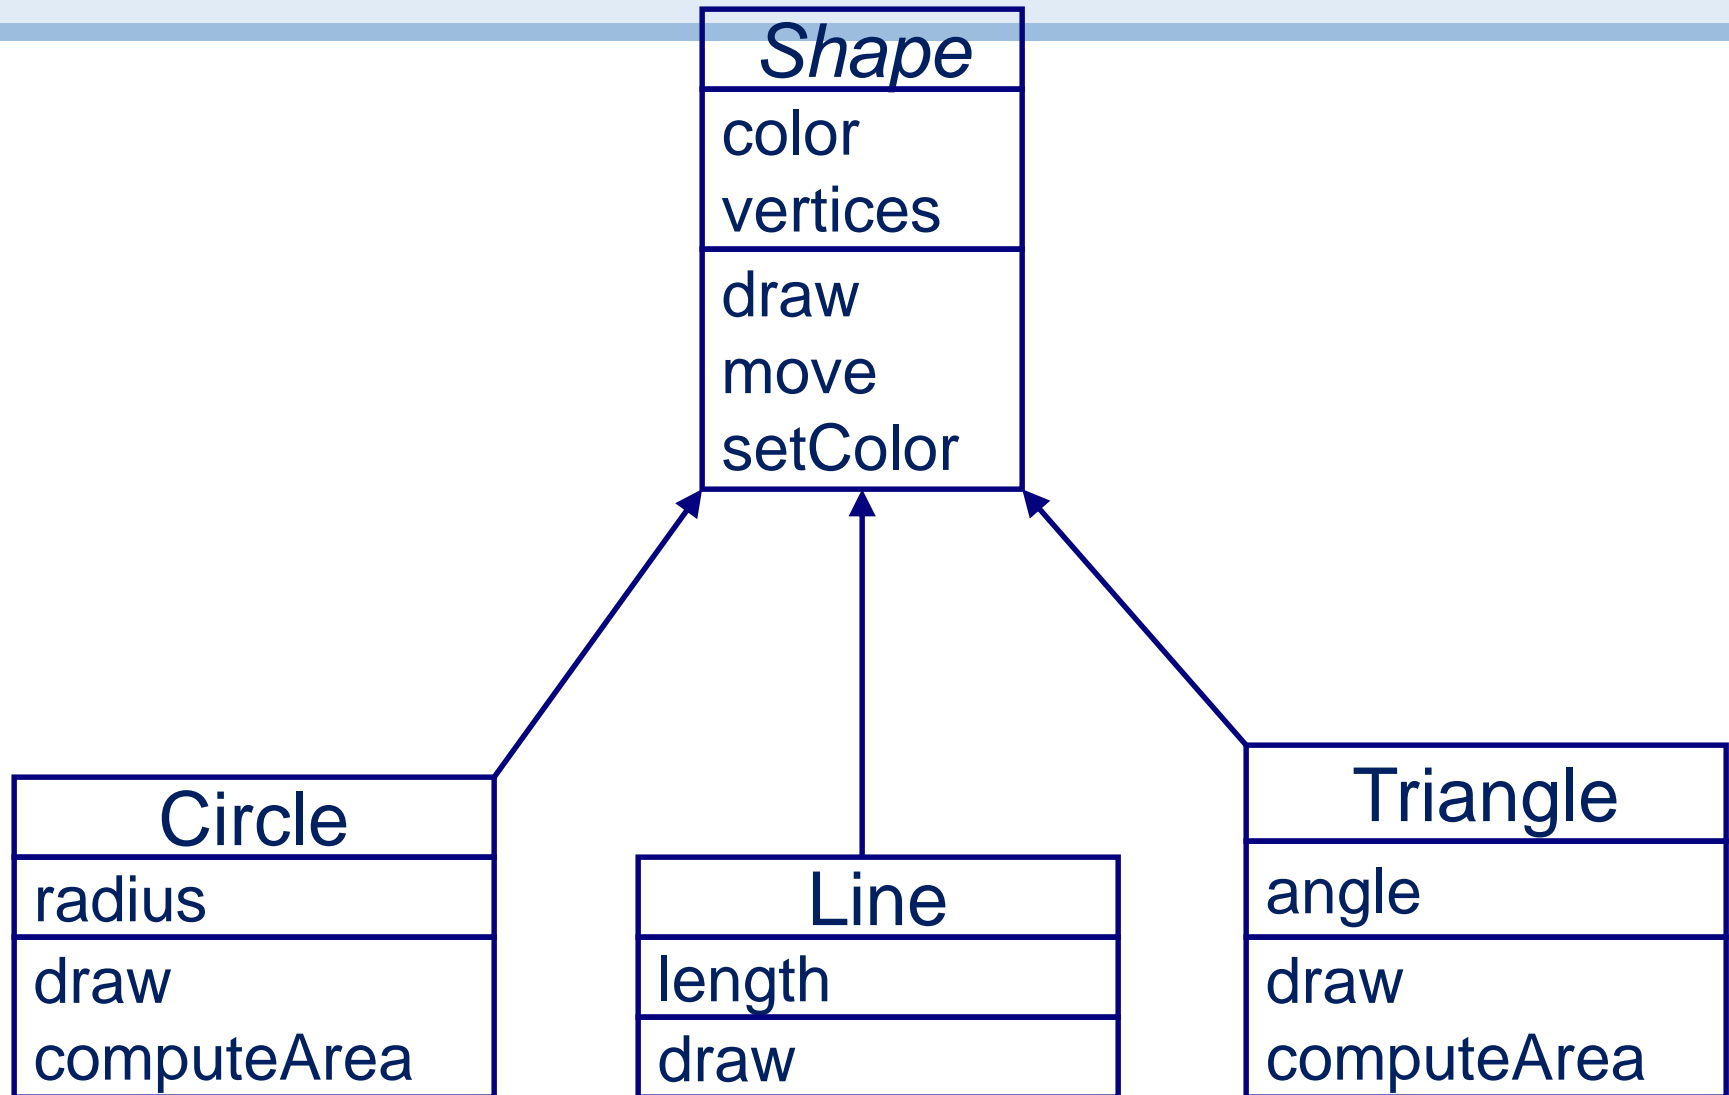

# Example – Specialization (Restriction)

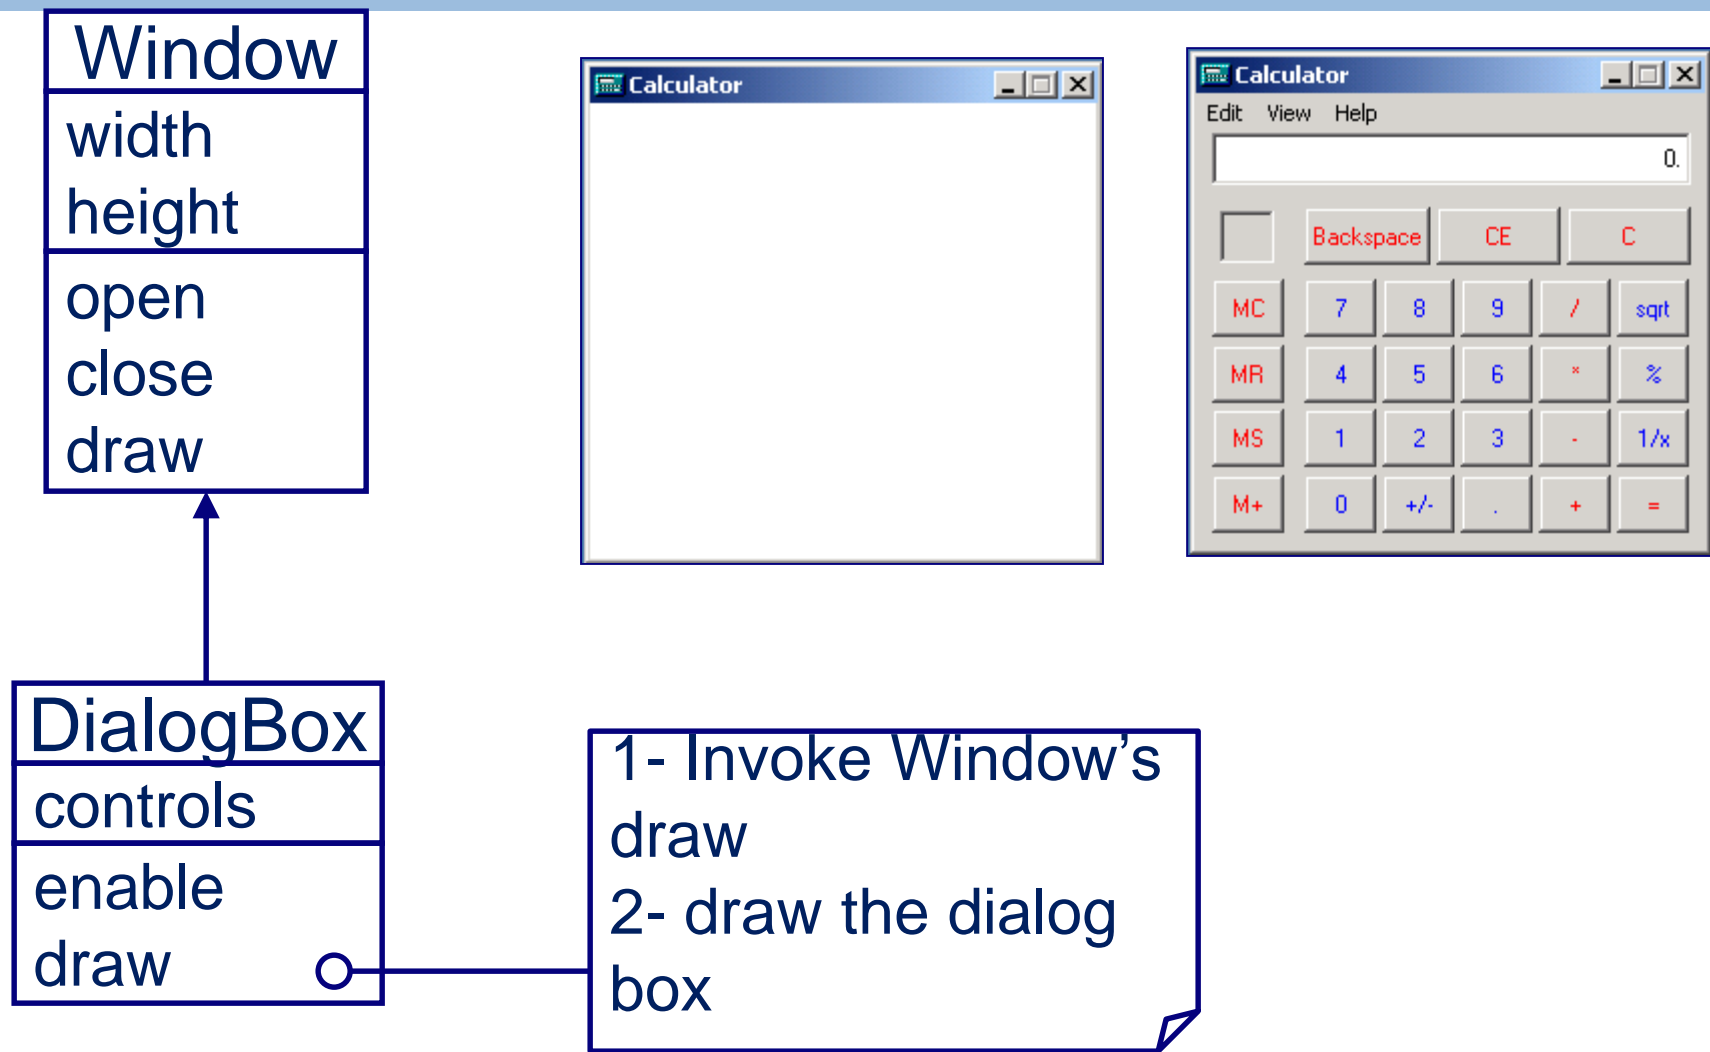

# Overriding

- > A class may need to override the default behavior provided by its base class
- > Reasons for overriding
  - Provide behavior specific to a derived class
  - Extend the default behavior
  - Restrict the default behavior
  - Improve performance

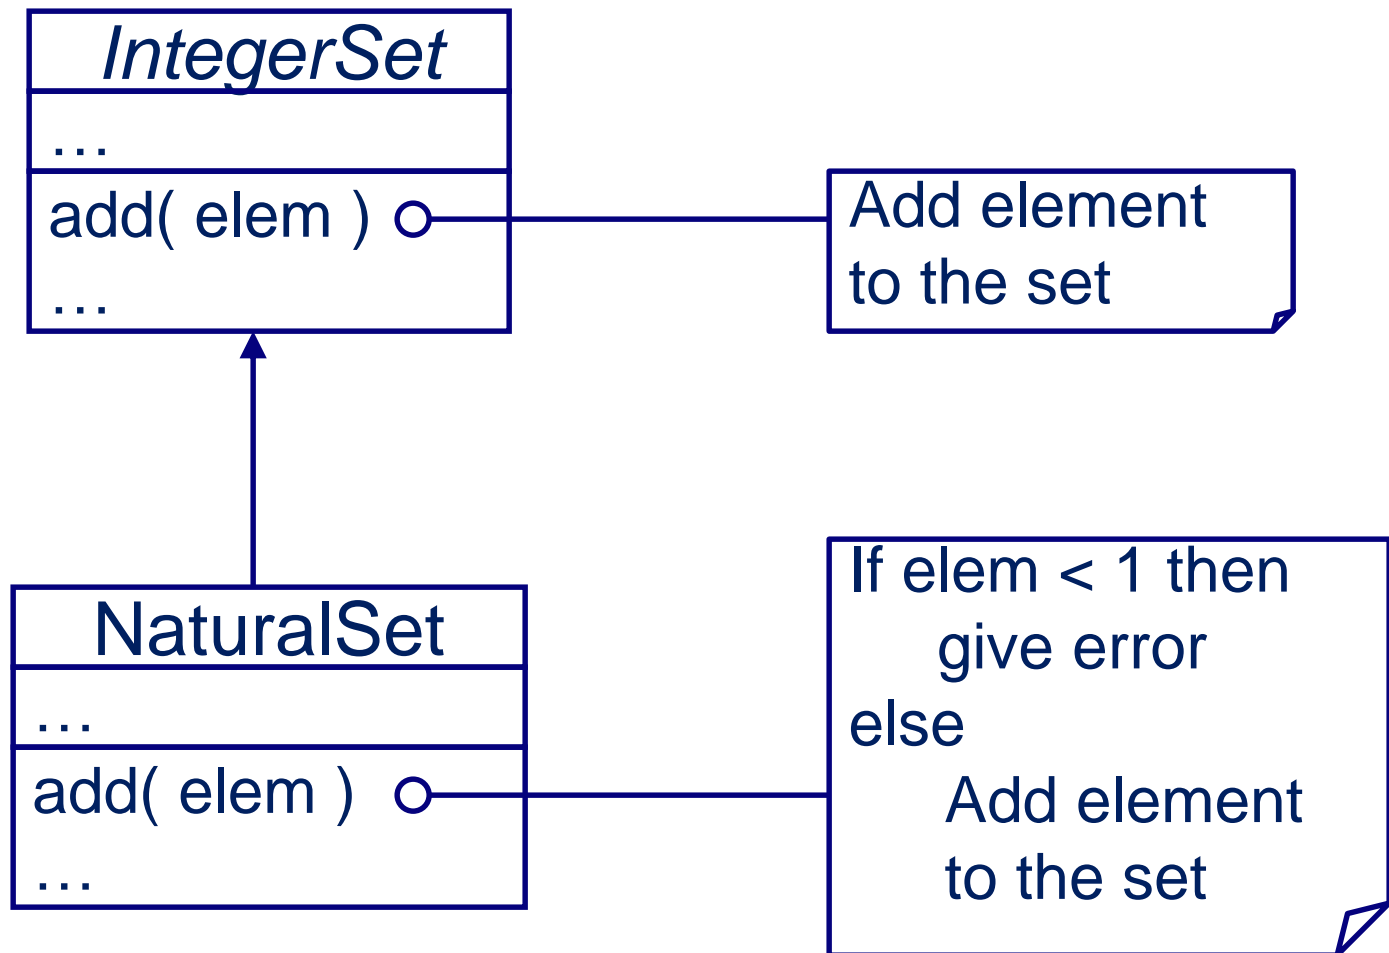

## Example – Specific Behaviour

# Example – Extension

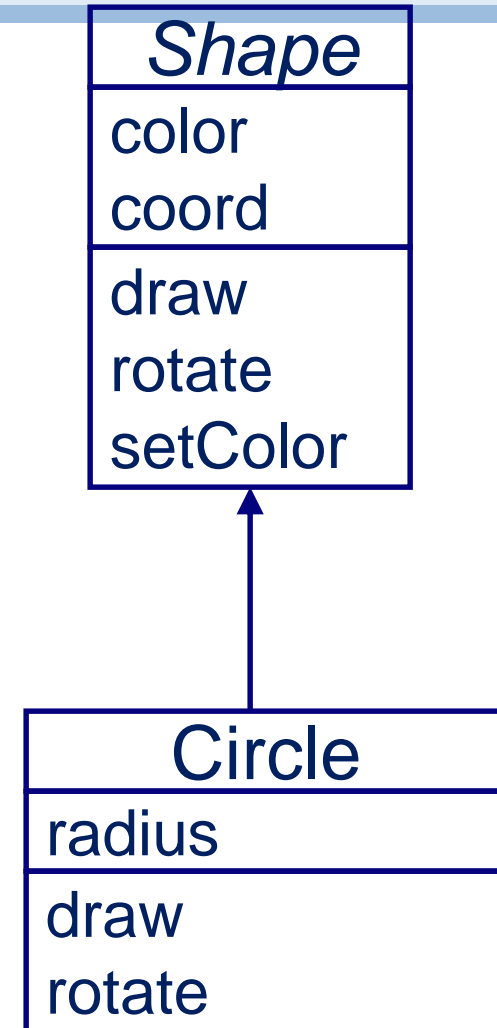

## Example – Restriction

# Example – Improve Performance

- > Class Circle overrides *rotate* operation of class Shape with a Null operation.

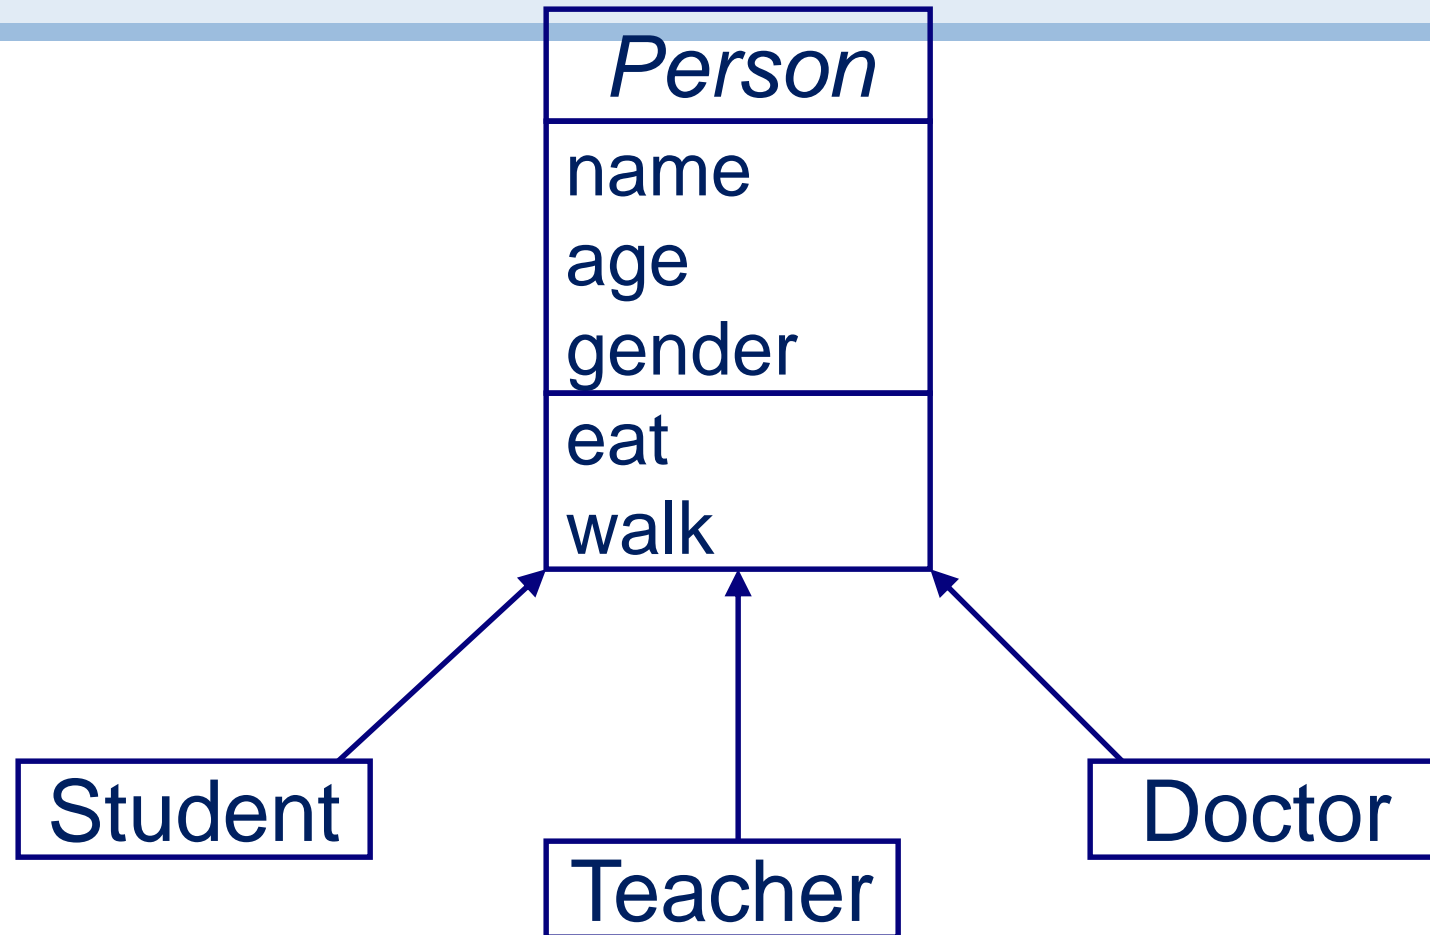

# Abstract Classes

- > An abstract class implements an abstract concept
- > Main purpose is to be inherited by other classes
- > Can't be instantiated
- > Promotes **reuse**

## Example – Abstract Classes

> Here, Person is an abstract class

## Example – Abstract Classes

- > Here, *Vehicle* is an abstract class

# Concrete Classes

- > A concrete class implements a concrete concept
- > Main purpose is to be instantiated
- > Provides implementation details specific to the domain context

## Example – Concrete Classes

> Here, Student, Teacher and Doctor are concrete classes

## Example – Concrete Classes

- Here, Car, Bus and Truck are concrete classes
